During the development of a wind farm on your territory, we support you in a broader reflection on the energy transition on a local scale.

1 Contributing to the energy efficiency of buildings

In the development phase, Velocita Energies offers to carry out **energy performance audits** of the municipal buildings and the dwellings near the project. The supporting measures related to the commissioning of the wind farm can then be dedicated to energy improvement works.

2 Develop your energy mix

As part of the development of the project, we carry out a **study of the potential for renewable energy production** of your territory. Depending on the available wind and solar energy sources, we evaluate the energy mix adapted to your needs.

The production of renewable electricity is an opportunity and Velocita Energies reinforces this approach by offering you a range of innovative solutions for :

3 Benefit from a green electricity offer

In partnership with a green energy supplier, **we offer green electricity at a preferential rate** for private individuals and small professionals residing in the municipalities where the wind farm is located.

4 Promote sustainable mobility

Once the wind farm is commissioned, **we provide you with an electric vehicle and a recharging station** that can be used, for example, by your local authority's technical services.
